

On Cue

Know your next action. Get to camera roll faster.

Fictional prototype notice: This is a fictional workflow demonstration. All productions, people, characters, locations, schedules, tasks, and events shown are invented. No real production data, call sheets, personal information, or performance data is used or represented.

The problem

A shoot day runs through call sheets, radios, texts, verbal check-ins, department leads, and changing conditions. When a take is delayed or needs to be reset, the right people need to act quickly—but most people do not need every detail of the production.

The idea

On Cue is a role-based coordination tool for television production. It gives each person a private **My Day** view that answers four questions:

- Where do I go?
- When am I needed?
- What is my next action?
- What is holding the next camera roll?

It is designed to work alongside the official call sheet, radio, AD team, and department leadership—not replace them.

What happens after a reset

In the fictional demo, a take stops because an actor needs a reset and lighting needs an adjustment.

- The **Gaffer** receives a lighting task and target-ready time.
- **Wardrobe** and **Talent Support** receive the relevant reset and continuity task.
- The **1st AD** sees a department-level readiness summary and predicted roll time.
- The **Director** and **Camera** receive only useful awareness that the setup remains on hold.
- Unrelated departments are not flooded with private or irrelevant details.

What On Cue is not

- Not a replacement for the call sheet, radio, AD team, or department heads
- Not a performance scorecard or surveillance tool
- Not an app that decides who is to blame for a delay
- Not an app that automatically tells a crew to roll camera
- Not built with real information from any production

What I am asking

I am testing a fictional prototype before building further. I would value a quick reality check:

- What does this get right about your workflow?
- What does it get wrong?
- What information would you need to see?
- What information should never appear on your screen?
- What would make a tool like this useful—or impossible to use—on a real set?
