On Cue — Product Requirements Document

> *Fictional prototype notice: This document describes a fictional workflow demonstration. All productions, people, characters, locations, schedules, tasks, events, and workflow data are invented. It does not use or represent data from FBI or any actual production.*

Product: On Cue

Document type: Product Requirements Document

Status: Prototype / workflow-validation stage

Primary audience: Product owner, design, engineering, pilot partners

Version: 0.2

Changelog from 0.1: *Added §9.6 Continuity Notes (Wardrobe) defining a concrete written-input flow — this did not exist in 0.1, which named "approved continuity notes" as a Wardrobe data point without specifying who writes them or where. Amended §9.2 Live Take to make explicit that the Script Supervisor's "notes" field is free text, not another category list. Updated the §6 Wardrobe row to match. Added two items to §16 Open Questions.*

1. Product summary

On Cue is a role-based, next-action coordination workspace for episodic television production. It translates approved shoot-day information and live readiness updates into private, role-relevant views. It helps teams coordinate the period before and between takes while keeping the 1st AD and authorized department leads in control of operational decisions.

The core product question is not "How can everyone see everything?" It is:

> *How can each person see the minimum accurate information needed to help the current setup reach camera roll?*

2. Problem statement

A shoot day runs through call sheets, shooting schedules, radios, texts, verbal check-ins, department leads, and rapidly changing conditions. When a take needs to be reset or a setup is delayed, the relevant departments need a clear, timely handoff. At the same time, most cast and crew members do not need the full production plan or other departments' sensitive details.

Current friction can include:

- Unclear ownership after a take is stopped or repeated
- Repeated status check-ins while a setup is on hold
- Irrelevant notifications and information overload
- Difficulty seeing which department is needed before the next camera roll
- Loss of context between a take outcome, reset reason, and required action
- Limited visibility for the AD team into aggregate readiness without exposing private details

3. Product vision

On Cue makes the current setup legible to the people responsible for it. Each person opens a focused “My Day” workspace showing where to go, when to be ready, what to do next, and only the relevant reason a setup is waiting.

The product supports existing production practices. It does not replace call sheets, radios, Assistant Directors, department heads, or human judgment.

4. Product goals

- Give each user a role-specific next action, location, target time, and status.
- Let authorized users record a lightweight take outcome and reset cause.
- Route role-specific action cards to only the departments responsible for a selected cause.
- Give the 1st AD a fast readiness summary without exposing private notes.
- Preserve an auditable record of status changes and routing decisions.
- Demonstrate a safe, controlled agentic model where humans retain authority.

5. Non-goals

- Replacing the official call sheet or AD workflow
- Eliminating creative retakes
- Assigning fault or scoring individual performance
- Making autonomous scheduling, safety, staffing, or camera-roll decisions
- Managing payroll, unions, contracts, personal contacts, or medical information
- Using real production data in the prototype

6. Users and needs

User	Primary need	On Cue response
1st AD	Understand setup readiness and decide whether to roll	Department-level readiness, blocker categories, ETAs, explicit approval control
Director	Know whether the setup is ready and convey high-level creative context	Current setup, take state, relevant high-level hold status
DP	Understand the current/next setup and visual readiness	Setup and relevant camera/lighting status without private talent information
Gaffer	Complete lighting work and report status	Lighting-only action card, location, target time, equipment/power context
Script Supervisor	Record take and continuity outcomes	Slate, take, outcome, categorized reset causes, **free-text take notes**

User	Primary need	On Cue response
Wardrobe	Maintain look and continuity readiness	Character, look, **continuity notes written by Wardrobe at time of capture** (see §9.6), reset task
Talent Assistant	Move performer support through the approved plan	Where/when needed, readiness request, approved context
Producer	Understand aggregate schedule risk	High-level status and pattern information without personal notes

7. Prototype scenario

Field	Demo value
Production	Harbor Unit
Episode	104
Shoot day	12
Location	Brooklyn Loft
Scene	42 — Detective Vale confronts a witness
Setup	14B — Medium two-shot at kitchen island
Time	10:35 AM
Target roll	10:42 AM
Starting status	HOLD
Take event	Take 5 stops at 00:38
Causes	Actor line reset; lighting adjustment
Lighting ETA	3 minutes
Talent ETA	4 minutes

8. Core workflow

```
Approved shoot-day plan / sample call-sheet data
             |
Role assignments and visibility rules
             |
Each user receives a "My Day" view
             |
Take outcome or blocker is recorded
             |
Harness validates and classifies the event
```

```
              |
Harness routes action cards to responsible roles
              |
Departments mark Ready, Need Time, or Report Issue
              |
AD sees aggregate readiness
              |
1st AD explicitly approves camera roll
```

9. Functional requirements

9.1 My Day

- The app must provide a role-specific landing view.
- It must show the current setup, relevant location, target time, status, next action, and relevant change summary.
- It must not show the entire production plan by default.
- A role switcher is acceptable for the fictional prototype.

9.2 Live Take

- An authorized Script Supervisor or AD user can record scene, setup, slate/take, outcome, and reset causes.
- Available cause categories: Actor reset, Lighting adjustment, Camera/focus, Sound, Continuity, Props/set, Director additional option, Technical issue, Other.
- **The Script Supervisor can additionally enter a short free-text note per take** — this is written input, not a category selection, and is separate from the reset-cause chips above.
- A note is optional unless the selected cause is “Other,” in which case a note is required.
- Selecting a cause must create only approved role-specific tasks.

9.3 Readiness and approval

- Gaffer can mark lighting ready or request more time.
- Wardrobe and Talent Assistant can mark performer readiness or report an issue.
- The system must calculate setup state from required readiness items.
- When lighting and talent are ready, the state becomes Ready for AD Approval.
- The system must not automatically roll camera.
- Only the 1st AD can transition from Ready for AD Approval to Camera Roll Approved.

9.4 Agent Activity

- The app must display an audit/activity feed for the demo.
- Each entry must include time, actor or system source, event, routing result, and visibility level.
- The activity feed must show that the harness—not an autonomous agent—validated and routed the action.

9.5 Reset

- The app must include a Reset Demo control.
- Reset restores the initial fictional HOLD state and clears simulated status changes created during the demo.

9.6 Continuity Notes (Wardrobe) — new in v0.2

This section did not exist in PRD v0.1. The Users and Needs table (§6) named “approved continuity notes” as a Wardrobe data point without defining who writes them, when, or through what UI — the prototype implementation filled this gap with hardcoded fictional text and no input mechanism at all. This section defines the actual flow.

- An authorized Wardrobe user can attach a short free-text continuity note to a reference photo for the current character/look.
- A note is captured at the same moment as its reference photo — writing and photographing are one action, not two separate steps.
- Each note is timestamped and attributed to the authoring role automatically; notes are append-only and are not edited or deleted after submission, consistent with the auditable-record goal in §4.
- Reference photo slots default to Front and Back for every look. Wardrobe can add further detail shots as needed (e.g. a cuff, a prop, a stain) rather than being limited to a fixed preset list.
- *Open — not yet decided (see §16):* whether a role other than Wardrobe (e.g. Script Supervisor, who owns continuity in many real productions) may also author or amend a continuity note.

10. Routing requirements

Selected cause	Task recipients	Awareness recipients	Restricted from
Actor reset	Talent Assistant, Wardrobe	1st AD, Director, Camera	Gaffer does not see continuity notes
Lighting adjustment	Gaffer	1st AD, DP, Director, Camera	Wardrobe does not see equipment/power details
Sound issue	Sound	1st AD, Director, Camera	Other departments see only high-level hold state
Continuity issue	Wardrobe, Script Supervisor	1st AD	Producer sees aggregate status only
Camera/focus	Camera / DP	1st AD, Director	Other departments see only high-level hold state

11. Permissions and privacy

- Every event must be associated with an actor role and timestamp.
- The harness must authorize an action before changing state.
- Users see role-relevant data only.

- The 1st AD sees department-level blockers but not private talent notes.
- The Producer sees aggregate, non-personal readiness and time-risk information.
- The prototype contains no sensitive, real, or personally identifying information.
- The product must avoid language that attributes blame to individuals.

12. Agent harness requirements

The prototype uses deterministic routing rules, not live LLM calls. The harness must support these conceptual functions:

```
validateEvent(event, actor)
authorizeAction(actor, action)
routeEvent(event)
createTask(ownerRole, task)
calculateSetupStatus()
appendAuditLog()
generateRoleSpecificMessage()
```

The harness owns authorization, visibility, logging, routing, and state transitions. Agents can only summarize, classify, recommend, and generate role-specific message drafts within the harness's constraints.

13. Screens

- My Day
- AD Command
- Live Take
- Lighting Console
- Wardrobe & Talent
- Take Intelligence
- Agent Activity

14. Success criteria

For prototype validation, success means:

- A user identifies their next action, location, and target time in under 10 seconds.
- A department lead reports Ready, Need Time, or Blocker in two interactions or fewer.
- The 1st AD identifies the department-level cause of a hold in under 10 seconds.
- A take-reset event creates only appropriate tasks and notifications.
- Users report receiving less irrelevant information than they expect from a full call-sheet view.
- The product is perceived as supporting coordination, not monitoring or blame.

15. Out of scope for this release

- Real call-sheet ingestion
- Production-software integrations
- Authentication and account management
- Offline mode, push notifications, SMS, radio integration
- Real maps or GPS
- Real-time multi-user collaboration
- AI model calls
- Automated recommendations that execute without a human

16. Open questions

- Which roles would adopt a dedicated interface during an active shoot?
- Which updates must happen via radio or in person rather than the app?
- What data can be safely imported from existing call-sheet/scheduling systems?
- Which status terms match actual on-set language for target users?
- How should a future product distinguish a creative retake from an operational reset?
- Who should be authorized to enter or amend take outcomes in different production contexts?
- **New:** Can any role besides Wardrobe author or amend a continuity note (e.g. Script Supervisor, who owns continuity in many real productions)?
- **New:** Should detail photo slots (beyond the default Front/Back) use a preset label list (Cuff, Collar, Prop, Stain...) for consistency across Wardrobe staff, or fully open labels?
